Introduction

This unique Hammond World Atlas is organized to make the retrieval of information as pleasant and quick as possible. Our guiding principle is to present individual subjects on separate maps. In this manner, each map topic is shown with the greatest degree of clarity, unencumbered by extraneous information. Equally important is the use of separate atlas units to present all information on a given country or state. Thus, the basic reference map of an area is accompanied on adjacent pages by all supplementary information relating to that area. For example, the detailed index for any map always appears on the same page as, or on the pages immediately following, the reference map. This index provides population data for many cities, towns, and villages shown on the map. Pertinent statistics on the area, i.e. the total population and area, the capital, and the highest point, are found in the summary fact listing accompanying each unit. An adjacent locator map relates the subject area to the larger world, and a "three-dimensional" picture of the area is provided by a full-color topographic map. A separate economic map defines vital agricultural, industrial, and mineral resources. The flag of each independent nation or state also appears on the appropriate page. Finally, certain country units contain special subject maps dealing with the history, climate, demography, and vegetation of the area.

Another section features The Physical World - an outstanding series of terrain maps of land forms and ocean floors. These physical maps were originally produced as sculptured terrain models, thus simulating the earth's surface in a highly realistic manner. The three-dimensional effect is both informative and pleasing to the eye.

Of course, the maps have been thoroughly updated. These revisions reflect the new nations, and shifting international boundaries, and internal divisions of many countries. Even new communities generated by the tapping of resources in developing nations are recorded. Thorough research and worldwide contacts provide the most up-to-date geographical and demographic information available.

Uniquely designed, comprehensive, and easy-to-use, this World Atlas is the ideal reference for families, executives, students, travelers, or anyone who wants to be geographically informed about today's fast-changing world. Enjoy the adventure as you explore the pages of one of the world's finest atlases.

The Publisher

Introduction to the Maps and Indexes

The following notes have been added to aid the reader in making the best use of this atlas. Though the reader may be familiar with maps and map indexes, the publisher believes that a quick review of the material below will add to his enjoyment of this reference work.

Arrangement—The Plan of the Atlas. The atlas has been designed with maximum convenience for the user as its objective. Part I of the atlas is devoted to the physical world—terrain maps of land forms and the sea floor. Part II contains the general political reference maps, area by area. All geographically related information pertaining to a country or region appears on adjacent pages, eliminating the task of searching throughout the entire volume for data on a given area. Thus, the reader will find, conveniently assembled, political, topographic, economic and special maps of a political area or region, accompanied by detailed map indexes, statistical data, and illustrations of the national flags of the area.

The sequence of country units in this American-designed atlas is international in arrangement. Units on the world as a whole are followed by a section on the polar regions which, in turn, is followed by pages devoted to Europe and its countries. Every continent map is accompanied by special population distribution, climatic and vegetation maps of that continent. Following the maps of the European continent and its countries, the geographic sequence plan proceeds as follows: Asia, the Pacific and Australia, Africa, South America, North America, and ends with detailed coverage on the United States.

Political Maps—The Primary Reference Tool. The most detailed maps in each country unit are the *political maps.* It is our feeling that the reader is likely to refer to these maps more often than to any other in the book when confronted by such questions as—Where? How big? What is it near? Answering these common queries is the function of the political maps. Each political map stresses *political* phenomena—countries, internal political divisions, boundaries, cities and towns. The major political unit or units, shown on the map, are banded in distinctive colors for easy identification and delineation. First-order political subdivisions (states, provinces, counties on the state maps) are shown, scale permitting.

The reader is advised to make use of the *legend* appearing under the title on each political map. Map *symbols,* the special "language" of maps, are explained in the legend. Each variety of dot, circle, star or interrupted line has a special meaning which should be clearly understood by the user so that he may interpret the map data correctly.

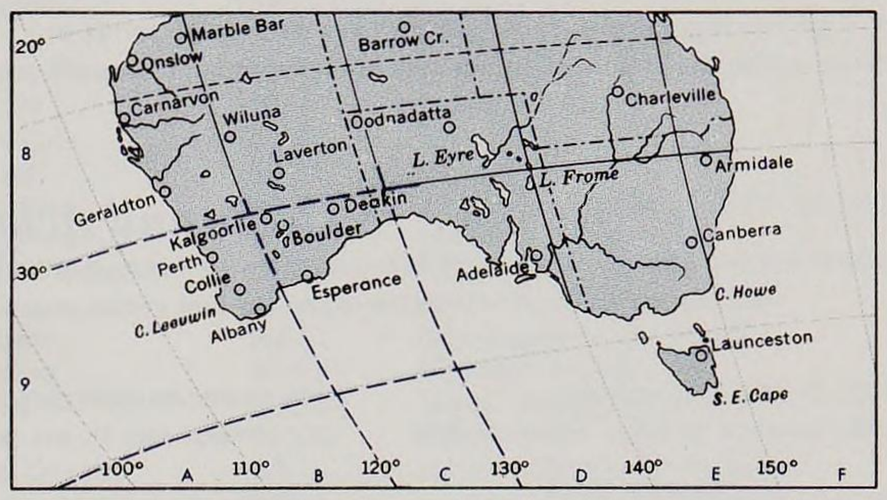

Each country has been portrayed at a *scale* commensurate with its political, areal, economic or tourist importance. In certain cases, a whole map unit may be devoted to a single nation if that nation is considered to be of prime interest to most atlas users. In other cases, several nations will be shown on a single map if, as separate entities, they are of lesser relative importance. Areas of dense settlement and important significance within a country have been enlarged and portrayed in inset maps inserted on the margins of the main map. The scale of each map is indicated as a fractional representation (1:1,000,000). The reader is advised to refer to the linear or "bar" scale appearing on each map or map inset in order to determine the distance between points.

The *projection* system used for each map is noted near the title of the map. Map projections are the special graphic systems used by cartographers to render the curved three-dimensional surface of the globe on a flat surface. Optimum map projections determined by the attributes of the area have been used by the publishers for each map in the atlas.

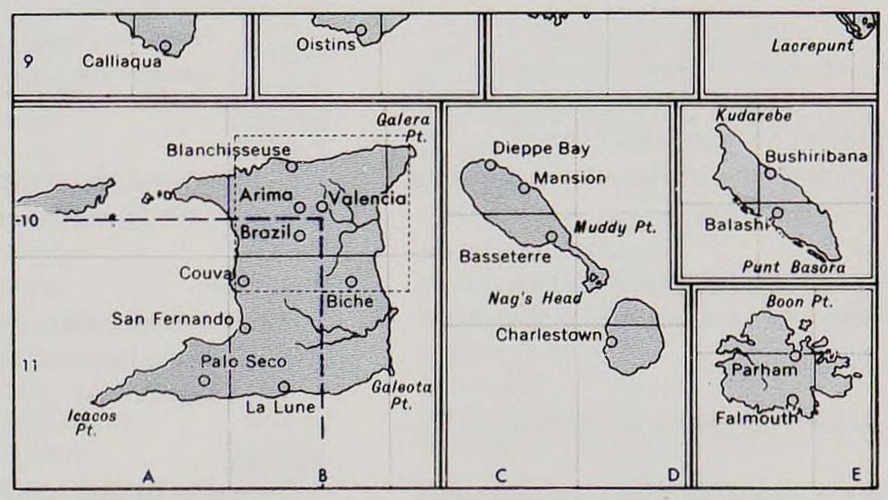

A word here as to the choice of place names on the maps. Throughout the atlas names appear, with a few exceptions, in their local official spellings. However, conventional Anglicized spellings are used for major geographical divisions and for towns and topographic features for which English forms exist; i.e., "Spain" instead of "España" or "Munich" instead of "München." Names of this type are normally followed by the local official spelling in parentheses. As an aid to the user the indexes are cross-referenced for all current and most former spellings of such names.

Names of cities and towns in the United States follow the forms listed in the *Post Office Directory* of the United States Postal Service. Domestic physical names follow the decisions of the Board on Geographic Names, U.S. Department of the Interior, and of various state geographic name boards. It is the belief of the publishers that the boundaries shown in a general reference atlas should reflect current geographic and political realities. This policy has been followed consistently in the atlas. The presentation of *de facto* boundaries in cases of territorial dispute between various nations does not imply the political endorsement of such boundaries by the publisher, but simply the honest representation of boundaries as they exist at the time of the printing of the atlas maps.

Indexes—Pinpointing a Location. Each political map is accompanied by a comprehensive index of the place names appearing on the map. If you are unfamiliar with the location of a particular geographical place and wish to find its position within the confines of the subject area of the map, consult the map index as your first step. The name of the feature sought will be found in its proper alphabetical sequence with a key reference letter-number combination corresponding to its location on the map. After noting the key reference letter-number combination for the place name, turn to the map. The place name will be found within the square formed by the two lines of latitude and the two lines of longitude which enclose the coordinates—i.e., the marginal letters and numbers. The diagram below illustrates the system of indexing.

In the case of maps consisting entirely of insets, the place name is found near the intersection point of the imaginary lines connecting the coordinates at right angles. See below.

Where space on the map has not permitted giving the complete form of the place name, the complete form is shown in the index. Where a place is known by more than one name or by various spellings of the same name, the different forms have been included in the index. Physical features are listed under their proper names and not according to their generic terms; that is to say, Rio Negro will be found under Negro and not under Rio Negro. On the other hand, Rio Grande will be found under Rio Grande. Accompanying most index entries for cities and towns, and for other political units, are *population figures* for the particular entries. The large number of population figures in the atlas makes this work one of the most comprehensive statistical sources available to the public today. The population figures have been taken from the latest official censuses and estimates of the various nations.

Population and area figures for countries and major political units are listed in bold type *fact lists* on the margins of the index. In addition, the capital, largest city, highest point, monetary unit, principal languages and the prevailing religions of the country concerned are also listed, The Gazetteer-Index of the World on the following pages provides a quick reference index for countries and other important areas. Though population and area figures for each major unit are also found in the map section, the Gazetteer-Index provides a conveniently arranged statistical comparison contained in five pages.

Relief Maps. Accompanying each political map is a relief map of the area. The purpose of the relief map is to illustrate the surface configuration (TOPOGRAPHY) of the region. A shading technique in color simulates the relative ruggedness of the terrain — plains, plateaus, valleys, hills and mountains. Graded colors, ranging from greens for lowlands, yellows for intermediate elevations to brown in the highlands, indicate the height above sea level of each part of the land. A vertical scale at the margin of the map shows the approximate height in meters and feet represented by each color.

Economic Maps—Agriculture, Industry and Resources. One of the most interesting features that will be found in each country unit is the economic map. From this map one can determine the basic activities of a nation as expressed through its economy. A perusal of the map yields a full understanding of the area's economic geography and natural resources.

The agricultural economy is manifested in two ways: color bands and commodity names. The color bands express broad categories of dominant land use, such as cereal belts, forest lands, livestock range lands or nonagricultural wastes. The red commodity names, on the other hand, pinpoint the areas of production of *specific* crops, i.e., wheat, cotton, sugar beets, etc.

Major mineral occurrences are denoted by standard letter symbols appearing in blue. The relative size of the letter symbols signifies the relative importance of the deposit.

The manufacturing sector of the economy is presented by means of diagonal line patterns expressing the various *industrial* areas of consequence within a country.

The fishing industry is represented by names of commercial fish species appearing offshore in blue letters. Major waterpower sites are designated by blue symbols.

The publishers have tried to make this work the most comprehensive and useful atlas available, and it is hoped that it will prove a valuable reference work. Any constructive suggestions from the reader will be welcomed.

Gazetteer-Index of the World

This alphabetical list of continents, countries, states, possessions and other major geographical areas provides a quick reference to their area in square miles and square kilometers, population, capital or chief town, map page number and an alpha-numeric index reference. The index reference indicates the square on the respective page in which the name may be found. The population figures used in each case are the latest reliable figures obtainable. The government listings are based primarily on the nomenclature contained in the World Factbook published by the CIA of the United States Government. Those governments currently unsettled or in transition are indicated with a † symbol.

Index to Terrain Maps

on pages X through XXXII

This index contains only names of land and ocean physical features. Names of towns, internal divisions and countries are not included. The entry name is followed by a letter-number combination which refers to the area on the map in which the name will be found. The number following the map reference for the entry refers, not to the page on which the entry will be found, but to the map plate number.

RELIEF MODELS BY ERNST G. HOFMANN, ASSISTED BY RAFAEL MARTINEZ

The oblique view diagram above is designed to provide a detailed view of the ocean floor as if seen through the depth of the sea. Graduating blue tones are used to contrast ocean floor depths: from light blue to represent shallow continental shelves to dark blues in the greater depths. Land relief is shown in conventional hypsometric tints.

In this dramatic collection of topographic maps of continents, oceans and major regions of the world, Hammond introduces a revolutionary new technique in cartography.

While most maps depicting terrain are created from painted artwork that is then photographed, Hammond now premiers the use of a remarkable sculptured model mapping technique created by one of our master cartographers.

The process begins with the sculpting of large scale three-dimensional models. Once physical details have been etched on the models and refinements completed, relief work is checked for accurate elevation based on a vertical scale exaggerated for visual effect.

Finished models are airbrushed and painted, then photographed using a single northwesterly light source to achieve a striking three-dimensional effect. The result is the dynamic presentation of mountain ranges and peaks on land, and canyons, trenches and seamounts on the ocean floor. Never before have maps conveyed such rich beauty while providing a realistic representation of the world as we know it.

Plate 20 | **Middle America**

This map has been prepared with the North Pole as the mathematical center. From it, distances to any part of the world may be measured. On Mercator's map of the world, the polar regions are so scattered that their relatively small area and availability for flight routes are disregarded. Today, with airplanes following great circle courses, often within the Arctic Circle, polar projection maps are indispensable to the people of this air-minded age.

* City and suburbs.
† Population of urban area.

For centuries the Dutch have been renowned for the drainage of marshes and the construction of polders, i.e., arable land reclaimed from the sea. Future projects will convert much of the present IJsselmeer to agricultural land.

Historic Provinces

A resident of the city of Caen thinks of himself as a Norman rather than as a citizen of the modern department of Calvados. In spite of the passing of nearly two centuries, the historic provinces which existed before 1790 command the local patriotism of most Frenchmen.

Wine Regions

Climate, soil and variety of grape planted determine the quality of wine. Long, hot and fairly dry summers with cool, humid nights constitute an ideal climate. The nature of the soil is such a determining influence that identical grapes planted in Bordeaux, Burgundy and Champagne, will yield wines of widely different types.

* Former Yugoslav Republic of Macedonia

BULGARIA and GREECE are divided into regions and departments, respectively. Because of the scale no attempt has been made to delimit and name these subdivisions; their administrative centers have, however, been designated.

The larger divisions named in Greece are well-known geographical regions, without administrative function.

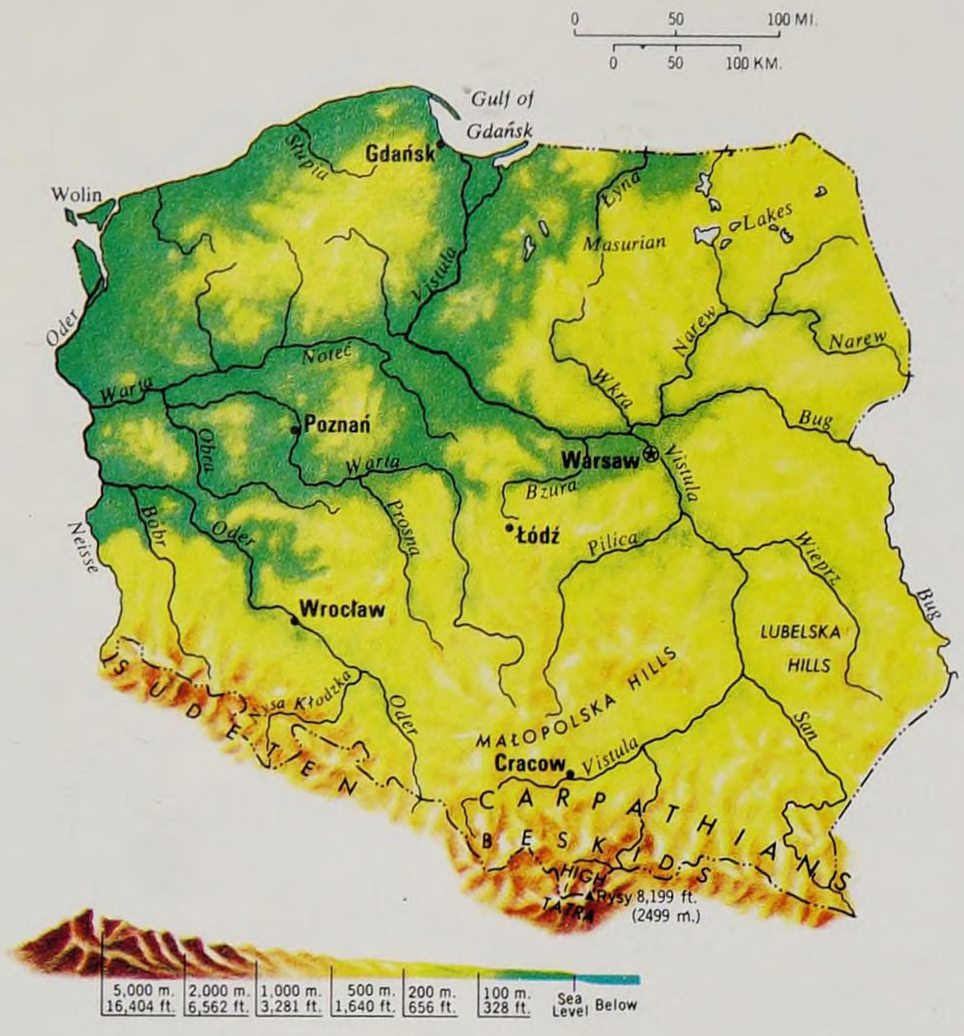

ROMANIA consists of thirty-nine counties and three cities of regional status, Bucharest, Constanţa and Petroşeni. Scale does not permit delimiting these counties.

ALBANIA is divided into twenty-seven districts. Scale does not permit the delimitation of these divisions.
